# Chapter 1

## Overview

This document describes steps to implement a host that supports multiple devices based on the MCUXpresso SDK USB stack.

The USB Stack provides one host demo that supports HID mouse + HID keyboard. A user may need a host to meet its requirements, such as the ability to support different class devices like supporting an HID and an MSD device simultaneously. This document provides a step-by-step guide to create a customizable host that supports multiple devices.

# Chapter 2

## Introduction

Unlike the composite device that requires many steps, implementing a host that supports multiple devices is simple. The event callback function of host and class can handle attach, enumeration, and detach processing for all the devices. The process flow for this is shown in Figure 1. This figure shows a host supporting two classes, which is the same as a host supporting one class. All class-specific functionality for the devices is achieved in the class-specific task polling in the main function. The user only needs to focus on the modification of these two points.

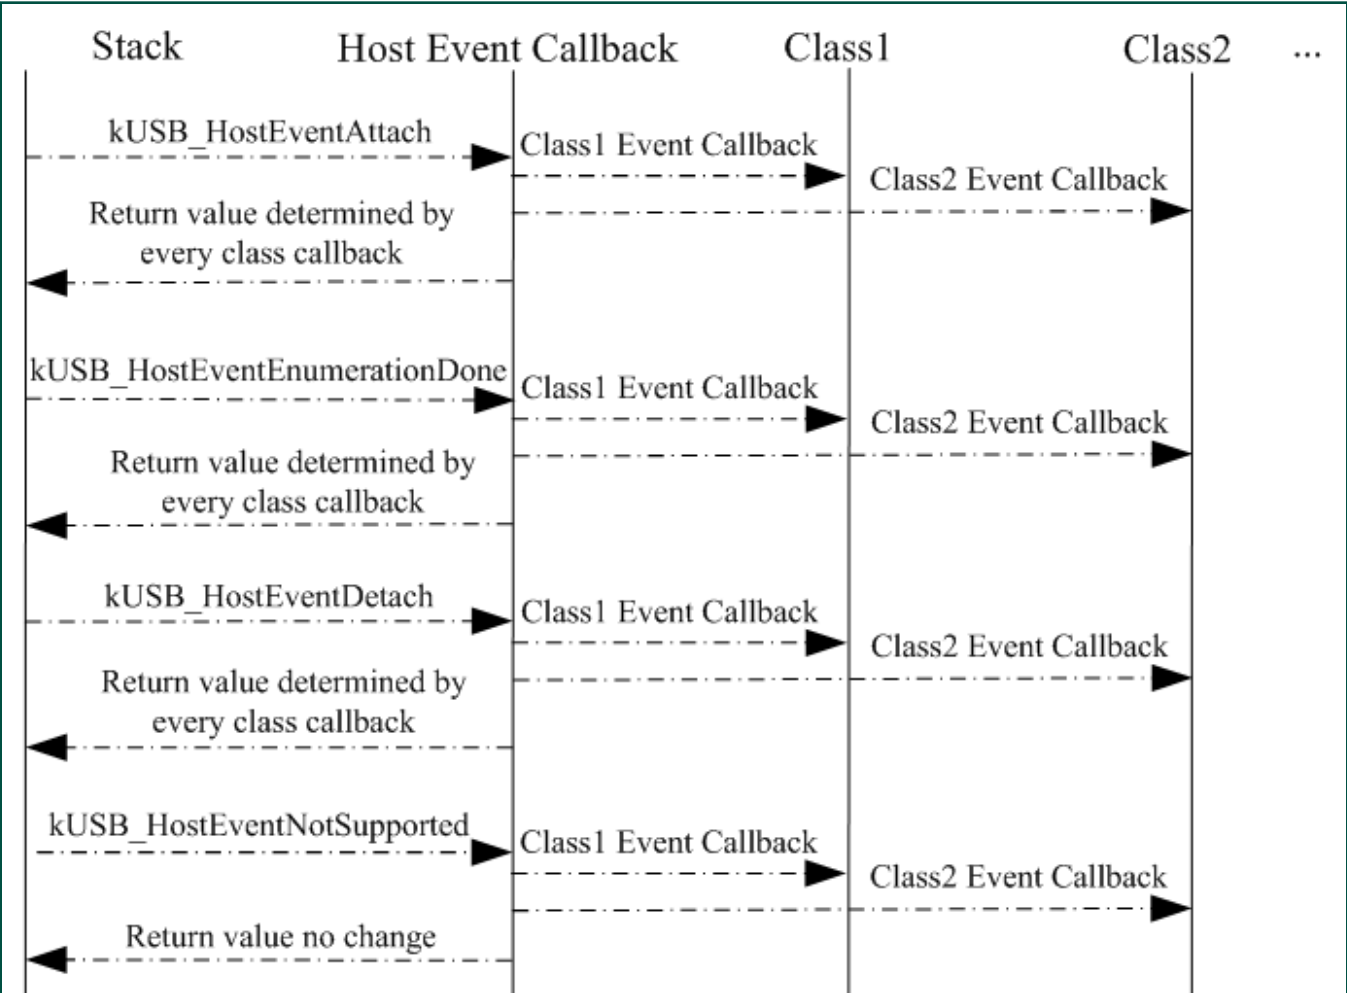

Figure 1. Process flow of event callback

## Chapter 3

# Detailed steps

Before developing the host that supports multiple devices, the user needs to determine:

1. How many classes this host needs to support.
2. How many subclasses for every class. For example, the HID class may include HID mouse and HID keyboard.

The code change for the host that supports HID mouse and HID keyboard is similar to that of the host supporting CDC virtual com and HID mouse.

### 3.1 Host event handle function

The USB\_HostEvent is a common handle function for attach, unsupported device, enumeration, and detach event. This function needs to call the class-specific event handle function. When the host only supports CDC devices, the USB\_HostEvent function is the following:

```
usb_status_t USB_HostEvent(usb_device_handle deviceHandle,
usb_host_configuration_handle configurationHandle,
uint32_t event_code)
{
usb_status_t status;
status = kStatus_USB_Success;
switch (event_code)
{
case kUSB_HostEventAttach:
status = USB_HostCdcEvent(deviceHandle, configurationHandle, event_code);
/* here add the new device's event handle function */
break;
case kUSB_HostEventNotSupported:
usb_echo("device not supported.\r\n");
break;
case kUSB_HostEventEnumerationDone:
status = USB_HostCdcEvent(deviceHandle, configurationHandle, event_code);
/* here add the new device's event handle function */
break;
case kUSB_HostEventDetach:
status = USB_HostCdcEvent(deviceHandle, configurationHandle, event_code);
/* here add the new device's event handle function */
break;
default:
break;
}
return status;
}
```

To support other devices, add the corresponding class-specific event handle function. Additionally, it is necessary to add the local variable to receive the return value of every event handle function. The return value of USB\_HostEvent should be changed according to the following occasions:

1. kUSB\_HostEventAttach: if the return values for all of the class-specific event handle functions are kUSB\_HostEventNotSupported, the return value of USB\_HostEvent is kUSB\_HostEventNotSupported.
2. kUSB\_HostEventNotSupported: no change.
3. kUSB\_HostEventEnumerationDone: if the return values for all of the class-specific event handle functions are not kStatus\_USB\_Success, the return value of USB\_HostEvent is kStatus\_USB\_Error.

4. `kUSB_HostEventDetach`: if the return values for all of the class-specific event handle functions are not `kStatus_USB_Success`, the return value of `USB_HostEvent` is `kStatus_USB_Error`.

## 3.2 Class-specific device task

The main function needs to schedule every supported device's task. If the host only supports CDC devices, the class-specific task in the main function is as follows:

```
int main(void)
{
    BOARD_InitHardware();
    APP_init();
    while (1)
    {
        USB_HostTaskFn(g_hostHandle);
        /* cdc class task */
        USB_HosCdcTask(&g_cdc);
        /* here add the new device's task */
    }
}
```

## Chapter 4

# Host MSD command + CDC virtual com example

This section provides a step-by-step example for how to implement a host that supports CDC virtual com and MSD command. This example is based on the existing host CDC virtual com example.

### 4.1 USB component files

Add the `usb_host_msd` component files, the `usb_host_msd_ufi` source file, and the `host_msd_command` component files into the current project. Normally, the `host_msd_command` component should be in the source folder, shown in Figure 2. The `usb_host_msd` component and the `usb_host_msd_ufi` source file should be located in the class folder showing in the Figure 3.

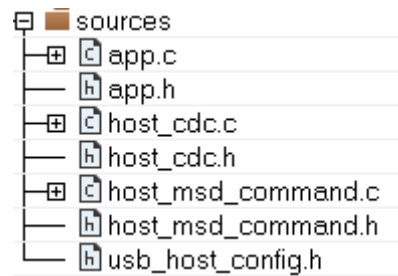

Figure 2. Source folder

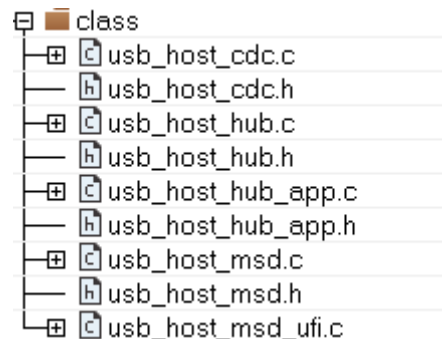

Figure 3. Class folder

### 4.2 USB\_HostEvent function

Add the `USB_HostMsdEvent` function into the `USB_HostEvent` function.

```

usb_status_t USB_HostEvent(usb_device_handle deviceHandle,
                           usb_host_configuration_handle
configurationHandle,
                           uint32_t event_code)
{
    usb_status_t status1;
    usb_status_t status2;
    usb_status_t status = kStatus_USB_Success;

    switch (event_code)
    {
        case kUSB_HostEventAttach:
            status1 = USB_HostCdcEvent(deviceHandle, configurationHandle, event_code);
  
```

```

        status2 = USB_HostMsEvent(deviceHandle, configurationHandle, event_code);
        if ((status1 == kStatus_USB_NotSupported) && (status2 ==
kStatus_USB_NotSupported))
        {
            status = kStatus_USB_NotSupported;
        }
        break;
case kUSB_HostEventNotSupported:
    usb_echo("device not supported.\r\n");
    break;

case kUSB_HostEventEnumerationDone:
    status1 = USB_HostCdcEvent(deviceHandle, configurationHandle, event_code);
    status2 = USB_HostMsEvent(deviceHandle, configurationHandle, event_code);
    if ((status1 != kStatus_USB_Success) && (status2 != kStatus_USB_Success))
    {
        status = kStatus_USB_Error;
    }
    break;

case kUSB_HostEventDetach:
    status1 = USB_HostCdcEvent(deviceHandle, configurationHandle, event_code);
    status2 = USB_HostMsEvent(deviceHandle, configurationHandle, event_code);
    if ((status1 != kStatus_USB_Success) && (status2 != kStatus_USB_Success))
    {
        status = kStatus_USB_Error;
    }
    break;

default:
    break;
}
return status;
}

```

### 4.3 Main function task

Add the USB\_HostMsTask function into the main function. The modified code should look like this:

```

int main(void)
{
    gpio_pin_config_t pinConfig;
    BOARD_InitPins();
    BOARD_BootClockRUN();
    BOARD_InitDebugConsole();
    /* enable usb host vbus */
    pinConfig.pinDirection = kGPIO_DigitalOutput;
    pinConfig.outputLogic = 1U;

    GPIO_PinInit(PTD, 8U, &pinConfig);

    APP_init();

    while (1)
    {
        USB_HostTaskFn(g_HostHandle);
        /* cdc class task */
        USB_HosCdcTask(&g_cdc);
        /* msd class task */
    }
}

```

```
        USB_HostMsdTask (&g_MsdCommandInstance);  
    }  
}
```

## Chapter 5

# Revision history

The following table summarizes the changes done to this document since the initial release.

**Table 1. Revision history**

Revision number	Date	Substantive changes
0	11/2018	Initial release
1	12/2018	2.4.0 vs 2.5.0
2	05/2020	Updated for MCUXpresso SDK v2.8.0
